TOPIC NAME

Explain briefly (1-2 sentences max)

Transforming Bike Safety Through Analytics

This study focuses on analyzing bicycle accidents in urban environments using a comprehensive French traffic accident database, aiming to identify key patterns and factors contributing to cycling incidents.

As a student what would you like to learn about this topic?

- How driver and cyclist behavior changes with different types of infrastructure
- What we can learn from cities with exceptional cycling safety records
- The influence of new mobility trends like e-bikes on accident patterns
- The impact of bike-sharing systems on accidents - do inexperienced riders using bike-share face higher risks?
- Whether there are safety disparities between wealthy and lower-income neighborhoods

Narrow down the topic

Cycling Safety at Bike-Sharing Stations: Analyzing Accident Patterns in Paris

Question: "How does proximity to Vélib' bike-sharing stations influence cycling accident patterns and severity in Paris?"

We would like to combine infrastructure analysis with the bike-sharing angle.

Many accident have take place due to poor infrastructure planning, we would like to study this aspect in particular.

What factors/key concepts impact your topic?

- **Physical Layout & Infrastructure:** Station placement, bike lane proximity, intersection design, and visibility - all shaping how riders interact with their environment
- **User Experience:** Mix of regular commuters, tourists, and occasional riders creating varied risk levels based on cycling competence
- **Time-Based Patterns:** Peak usage hours and seasonal variations affecting both ridership volume and potential accident risks
- **Urban Context:** Station location relative to attractions, business districts, and transit hubs influencing traffic patterns and user behavior
- **Station Operations:** Capacity and occupancy levels impacting how riders gather, enter, and exit the bike-sharing system
